DRIS™ Architecture & UI Framework

A Disaster Resilience Indexing System

OVERVIEW

Establishes architectural
and UI structure.

DRIS™ INDEX MODEL & CALIBRATION FRAMEWORK

DRIS™ Product Architecture and UI	2
DRIS UI Screens, Figma-Level Structure	9
UI Build Order	24
DRIS™ AI Architecture	25

DRIS™ PRODUCT ARCHITECTURE AND UI

KEY SYSTEM COMPONENTS

What the system structure should include:

- **Data tables**
- **Employee fields**
- **Basic dashboards**
- **Persona-based dashboards**
 - Different home screens per role
- **Permission layers**
 - Each persona should see:
 - Different data
 - Different actions
- **Workflow logic:**
 - Example:
 - Field user enters employee
 - State / Parish manager approves
 - Country admin validates

DRIS is a **scoring engine + calibration engine + classification engine**.

It transforms Inputs → Weighted Scoring → Calibration → Classification → Decision Outputs.

It produces:

- Readiness Score
- Risk/Gaps
- Recommended Actions
- Dashboards

This means: The UI must revolve around SCORING + INSIGHT – not just data entry

DRIS™ INDEX MODEL & CALIBRATION FRAMEWORK

DRIS SYSTEM ARCHITECTURE

There are **two layers**:

➔ **Layer 1 — Data Workflow**

Create → Validate → Approve → Lock

➔ **Layer 2 — Intelligence Engine**

KPI Input → Score → Calibrate → Classify → Recommend

CORE SYSTEM ARCHITECTURE

DRIS PLATFORM: A Unified Intelligence Framework for Disaster Resilience

PERSONA UI

A. Country Executive

Dashboard **MUST** include:

- **Resilience Score (Primary KPI)**
- Classification:
 - Resilient
 - Thriving
 - Needs Support
 - Not Yet Started
- Risk/Gaps
- Top 5 Actions
- State / Parish comparison

UI Blocks:

[Resilience Score Gauge]

[Classification Badge]

[Top Risks]

[Top 5 Immediate Actions]

[State / Parish Performance Table]

B. State / Parish Manager (Operational + Scoring)

Dashboard:

- State / Parish Score
- Domain breakdown (Housing, Health, etc.)
- Pending approvals
- Gap alerts

UI Component:

[Domain Radar Chart]

(From your document: Domain-level performance visualization)

C. Data Officer

This is where scoring starts. **UI:** KPI Input Forms

Example:

Recovery Coordinator Appointed?

[Yes / Partial / No]

Recovery Plan Exists?

[Yes / Partial / No]

NOTE: This feeds scoring directly.

D. Field User

- Data input
- Basic updates
- May input supporting evidence (documents)

E. System Governor

Responsibilities:

- KPI structure management
- Weight adjustments
- Calibration overrides

F. Auditor

Dashboard:

- Score validation
- KPI evidence review
- Audit trails

SCORE SCREENS

1. KPI Input Engine

Category: Governance

[Recovery Coordinator Appointed]

[Task Force Formed]

[Recovery Plan Exists]

2. Scoring Engine View

Show:

Section Score = Points Earned / Points Possible

3. Calibration Engine Screen

Show:

Raw Score → Adjusted Score

Include:

- Scenario calibration
- Expert adjustments

4. Classification Screen

Score: 72%

→ Thriving

Based on:

- 85–100 = Resilient
- 70–84 = Thriving
- 50–69 = Needs Support
- <50 = Not Yet Started

5. Critical KPI Flags (VERY IMPORTANT)

If no Recovery Plan → cap score at 70%

UI MUST SHOW:

Critical: Score capped due to missing critical KPI

6. AI Insights Panel (HIGH VALUE FEATURE)

- Top 5 Immediate Actions
- Top 5 Strategic Actions
- Barriers
- Partners

7. Scenario Simulator (ADVANCED FEATURE)

What happens if hurricane hits again?

Outputs:

- Score change
- Risk impact
- Cost estimates

8. Equity Dashboard (Unique Differentiator)

Women

LGBTQIA2+ (**CULTUREAL SENSITIVITY NOTE: Cannot include for countries such as Jamaica**)

Children

Low-income

Rural

Each shows:

- Gap
- Risk
- Recovery speed

DATA MODEL EXTENSION

MUST ADD:

KPI Model

KPI

- id
- category
- question
- weight
- is_critical

KPI Response

KPIResponse

- kpi_id
- value (0–3)
- evidence
- submitted_by

Score Model

Score

- section_score
- weighted_score
- calibrated_score
- final_score
- classification

IMPORTANT INSIGHT

DRIS™ has **three layers of value**:

1. Data (records, KPIs)
2. Intelligence (scoring, calibration)
3. Decisions (actions, insights, forecasts)

KEY DIFFERENTIATOR NOTE: Most systems stop at #1 and DRIS™ is all three.

DRIS™ INDEX MODEL & CALIBRATION FRAMEWORK

DRIS™ AI ARCHITECTURE

for Scoring, Recommendations, Simulations, and Equity-Adjusted Insights

DRIS AI should have **4 intelligence layers**:

1. Scoring AI
2. Recommendation AI
3. Scenario Simulation AI
4. Equity-Adjusted Insight AI

1) SCORING AI

Purpose

Convert raw data, documents, and evidence into structured KPI scores.

Inputs

KPI responses
Evidence documents
Government reports
Disaster assessments
Partner data
Satellite / hazard data
User-submitted updates

Output

KPI Score: 0–3
Confidence Score
Evidence Summary
Recommended Classification

Logic

AI reads evidence
→ maps evidence to KPI
→ assigns provisional score
→ human validates
→ score enters DRIS engine

Example:

KPI: Recovery Plan Exists

AI result:

Score = 2

Reason = Plan exists but outdated

Confidence = 78%

Human review required

2) SCORING ENGINE RULES

DRIS should not allow AI to freely invent scores.

Use:

Rules first

AI second

Human approval final

Scoring Model

0 = Not Started

1 = Partial

2 = In Progress / Documented

3 = Complete / Operational

N/A = Excluded from scoring

Formula

Section Score = Points Earned / Points Possible

Overall Score = Sum(Section Score × Weight)

Final Score = min(Calculated Score, Critical KPI Cap)

3) CRITICAL KPI CAP ENGINE

This is one of the most important parts.

Example rules:

No Recovery Coordinator → max score 60%

No Recovery Plan → max score 70%

No Finance Plan → max score 75%

No Tribal Engagement Framework, if applicable → max score 70%

AI role

AI detects when a critical KPI is missing or weak.

System behavior

Calculated Score: 82%

Missing Recovery Plan

Final Score capped at 70%

Classification: Thriving, not Resilient

4) RECOMMENDATION AI

Purpose

Turn score gaps into action plans.

Inputs

Low-scoring KPIs

Missing critical KPIs

Country/State / Parish profile

Disaster type

Population vulnerability

Available partners

Funding sources

Best practices

Outputs

Top 5 Immediate Actions

Top 5 Strategic Actions

Key Barriers

Potential Partners

Resource Recommendations

Recommendation Logic

If KPI score < threshold

→ identify gap

→ map to best practice

→ recommend action

→ attach resource or partner

Example:

Gap:

No long-term recovery finance plan

Recommendation:

Develop recovery finance plan within 90 days.

Potential partners:

World Bank, IDB, CCRIF, CDEMA, local finance ministry.

5) SCENARIO SIMULATION AI

Purpose

Allow leaders to test “what-if” scenarios.

Example questions

What happens if another Cat-4 hurricane hits within 3 years?

What if housing investment increases by 20%?

What if coastal protection doubles?

What if health system recovery is delayed?

Inputs

Current DRIS score

Hazard type

Time horizon

Investment levels

Population exposure

Infrastructure conditions

Economic dependency

Historical disaster data

Outputs

Projected DRIS score

Score shift

Estimated impact reduction

Cost-benefit summary

Risk level

Recommended mitigation actions

Simulation Flow

User selects scenario

→ AI applies assumptions

→ model estimates impact

→ DRIS score recalculates

→ recommendations update

6) EQUITY-ADJUSTED INSIGHT AI

Purpose

Show how recovery differs across vulnerable groups.

Equity groups

Women

LGBTQIA2+ (**CULTURAL SENSITIVITY NOTE: Cannot include for countries such as Jamaica**)

Children

Low-income communities

Rural / coastal communities

Persons with disabilities

Indigenous / Maroon communities

LGBTQIA2+ communities, where relevant and safely measurable (**CULTURAL SENSITIVITY NOTE: Cannot include for countries such as Jamaica**)

Outputs

Overall Domain Score

Equity-Adjusted Score

Service Access Gap

Recovery Timeline Gap

Risk Rating

Targeted Recommendations

Example:

Housing Recovery:

Overall Score: 72%

Low-Income Equity Score: 48%

Insight:

Recovery is progressing overall, but low-income households are significantly behind.

7) AI CONFIDENCE & HUMAN REVIEW

Every AI result should show:

AI Score

Confidence %

Evidence Used

Human Review Status

Reviewer Name

Approval Date

Confidence rules

90–100% = Auto-suggest, still reviewable

70–89% = Human review required

Below 70% = Cannot score automatically

8) AI DATA PIPELINE

Data Sources

ETL / API Intake

Document Parsing

KPI Mapping

AI Scoring

Human Validation

Calibration Engine

Classification Engine

Dashboard / Reports

9) AI SYSTEM COMPONENTS

Document Intelligence Engine

KPI Mapper

Evidence Extractor

Scoring Assistant

Critical KPI Cap Engine

Recommendation Engine

Scenario Simulator

Equity Analytics Engine

Mentor Matching Engine

Audit & Explainability Engine

10) AI EXPLAINABILITY REQUIREMENT

DRIS must always answer:

Why did this score change?

What evidence supports it?

Who approved it?

What rule was applied?

What action is recommended?

This is essential for government trust.

11) RECOMMENDED AI GOVERNANCE RULES

AI cannot finalize scores

AI cannot override critical KPI caps

AI cannot delete evidence

AI cannot approve records

AI must show evidence

AI must log all changes

Human reviewer finalizes score

12) BUILD PRIORITY

Phase 1 — AI Scoring Assistant

- Evidence upload
- KPI mapping
- Suggested score
- Confidence score
- Human validation

Phase 2 — Recommendation Engine

- Gap analysis
- Top actions
- Partner suggestions
- Resource links

Phase 3 — Equity Engine

- Group-level scoring
- Service access gaps
- Recovery timeline gaps
- Equity-adjusted score

Phase 4 — Scenario Simulator

- Hazard scenarios
- Investment scenarios
- Score shift projections
- Cost-benefit estimates

Phase 5 — Mentor Hub AI

- Detect mentor domains
- Match peer countries/State / Parishes
- Generate training packages

Core AI Principle

- AI supports judgment.
- Humans certify readiness.
- DRIS protects scoring integrity.
